# GLOBAL ELECTRONICS RETAILER

Executive Summary | Sales and Business Performance Analysis | 2017 to February 2021

**Objective.** This analysis examines changes in revenue and business performance across product categories, markets, customers, and stores. The goal was to identify meaningful patterns, highlight areas that warrant attention, and recommend where management should investigate further.

| $19.30M | 16.17% | 2,411 vs. 9,343 |
|---|---|---|
| Computer category revenue | Cell phone revenue growth | December orders: 2020 vs. 2019 |

## Key Findings

**1. Revenue and order activity show a recurring April pattern.** Across the period reviewed, April frequently showed a noticeable reduction in revenue, orders, and quantity sold, while revenue generally strengthened toward December. The repeated pattern is unusual and deserves further investigation. It should not be assumed to have a single cause based on this dataset alone.

**2. 2020 saw a marked reduction in business activity.** Revenue and order volume fell compared with earlier periods. December recorded 2,411 orders in 2020, compared with 9,343 in December 2019. This points to a substantial decrease in transaction volume, although it does not by itself explain why customers ordered less.

**3. Product category performance is changing.** Computers generated the most revenue, at approximately $19.30 million. Cell phones reached the second position in revenue and recorded 16.17% growth across the period, making them an increasingly important category.

**4. Market results differ when scale is considered.** The United States generated the highest revenue and had 24 stores. Canada generated approximately $4.25 million across five stores, with 12.24% revenue growth and a 58.26% gross profit margin. The Netherlands had comparatively lower revenue growth at 9.09%. These figures suggest that market size and growth should be considered together.

## Recommendations

**Investigate the April pattern.** Review seasonality, inventory availability, promotions, reporting completeness, and operational factors to understand why revenue and order activity repeatedly change during this month.

**Investigate the decline in order volume.** Compare order frequency, units per order, and average order value to determine whether the reduction is driven by fewer purchases, smaller baskets, or both.

## Limitations

The dataset contains only part of 2021, so that year is not directly comparable with complete years. Some stores show 0% growth, but the available data does not establish whether they were newly opened, inactive, or missing historical transactions. Some orders are not marked as delivered; the dataset does not explain whether these are delivery failures, incomplete records, or items that do not require physical delivery. The analysis identifies patterns and possible areas of concern, but cannot establish their underlying causes.

**Conclusion.** The analysis highlights a significant reduction in order activity during 2020, a recurring April pattern, and a growing contribution from cell phones. The most useful next step is to investigate the causes of the April changes and the decline in order volume before making operational or commercial decisions.
